Trends in HRT prescribing after WHI & MWS

Changes in HRT 10 years ago

- 2013 -WHI trial reported changing position with cumulative long term follow up outcomes HRT. No detrimental effect.
- 2015- NICE guideline published
- New HRT regimes, individualised treatments
- 2012 BMJ Window of opportunity -if HRT initiated before 60 years 50% reduction in coronary heart disease

Understanding the risks of breast cancer

A comparison of lifestyle risk factors versus Hormone Replacement Therapy (HRT) treatment.

independent service for women and their partners

Difference in breast cancer incidence per 1,000 women aged 50-59.

Approximate number of women developing breast cancer over the next five years.

Women's Health Concern is the patient arm of the BMS.

We provide an independent service to advise, reassure and educate women of all ages about their health, wellbeing and lifestyle concerns.

Society

BMS

British

Menopause

Popular HRT types used currently on prescription only

Mirena

Licensed for:

for use HRT alongside systemic oestrogen by any route

Contraceptive-still needed in perimenopause

Menstrual bleeding

Localised HRT and alternatives available OTC

Present day & present day challenges

- HRT stigma gone and raised awareness of benefits short and long term
- Individualised treatment for perimenopausal and menopause management
- Transdermal HRT, mirena and utrogestan
- Serious shortages (SSP) of HRT currently utrogestan as discrepancy in supply and demand
- HRT Prepayment certificate HRT PPC
